

What have you done?

You have trained a machine learning model to recognise when text is Positive_Praise, Negative_Complaint or Urgent_Support.

You created the model on Saturday, August 1, 2026 2:45 AM.

You have collected:

- 10 examples of Positive_Praise,
- 10 examples of Negative_Complaint,
- 10 examples of Urgent_Support

What's next?

Try testing the machine learning model below. Enter an example of text below, that you didn't include in the examples you used to train it. It will tell you what it recognises it as, and how confident it is in that.

If the computer seems to have learned to recognise things correctly, then you can go to Scratch and use what the computer has learned to make a game!

If the computer is getting too many things wrong, you might want to go back to the [Train](#) page and collect some more examples

Once you've done that, click on the button below to train a new machine learning model and see what difference the extra examples will make!

Try putting in some text to see how it is recognised based on your training.

Test

Train new machine learning model

What have you done?

You have trained a machine learning model to recognise when text is Positive_Praise, Negative_Complaint or Urgent_Support.

You created the model on Saturday, August 1, 2026 7:05 AM.

You have collected:

- 60 examples of Positive_Praise,
- 60 examples of Negative_Complaint,
- 60 examples of Urgent_Support

What's next?

Try testing the machine learning model below. Enter an example of text below, that you didn't include in the examples you used to train it. It will tell you what it recognises it as, and how confident it is in that.

If the computer seems to have learned to recognise things correctly, then you can go to Scratch and use what the computer has learned to make a game!

If the computer is getting too many things wrong, you might want to go back to the [Train](#) page and collect some more examples

Once you've done that, click on the button below to train a new machine learning model and see what difference the extra examples will make!

Try putting in some text to see how it is recognised based on your training.

What have you done?

You have trained a machine learning model to recognise when text is Positive_Praise, Negative_Complaint or 2 other classes.

You created the model on Saturday, August 1, 2026 7:34 AM.

You have collected:

- 60 examples of Positive_Praise,
- 60 examples of Negative_Complaint,
- 60 examples of Urgent_Support,
- 60 examples of Out_of_Scope

What's next?

Try testing the machine learning model below. Enter an example of text below, that you didn't include in the examples you used to train it. It will tell you what it recognises it as, and how confident it is in that.

If the computer seems to have learned to recognise things correctly, then you can go to Scratch and use what the computer has learned to make a game!

Using machine learning in Python

[Back to project](#)

You can use this code to submit text to the machine learning model that you've trained.

Enter the text:

The text that you want to test

Running this will print something like:

```
$ python yourscript.py
result: 'Positive_praise' with 81% confidence
```

[Click here for Python for adding a training example](#)

If you've never used `requests` before, you might need to install it first.

Ask your teacher for help if you're not sure how to do that.

```
import requests

# This function will pass your text to the machine learning model
# and return the top result with the highest confidence
def classify(text):
    key = "eca07a50-8d31-11f1-815a-955c88abebc8cf98999f-c1db-44a1-be2b-560716a68e72"
    url = "https://machinelearningforkids.co.uk/api/scratch/"+ key + "/classify"

    response = requests.get(url, params={ "data" : text })

    if response.ok:
        responseData = response.json()
        topMatch = responseData[0]
        return topMatch
    else:
        response.raise_for_status()

# CHANGE THIS to something you want your machine learning model to classify
demo = classify("The text that you want to test")

label = demo["class_name"]
confidence = demo["confidence"]

# CHANGE THIS to do something different with the result
print ("result: '%s' with %d%% confidence" % (label, confidence))
```

If you know how to use it, your API key for this project is:
