80 SHAW BOULEVARD
MANDALUYONG CITY

EXAMINATION BOOK

NAME MARES, ANTHONY S.

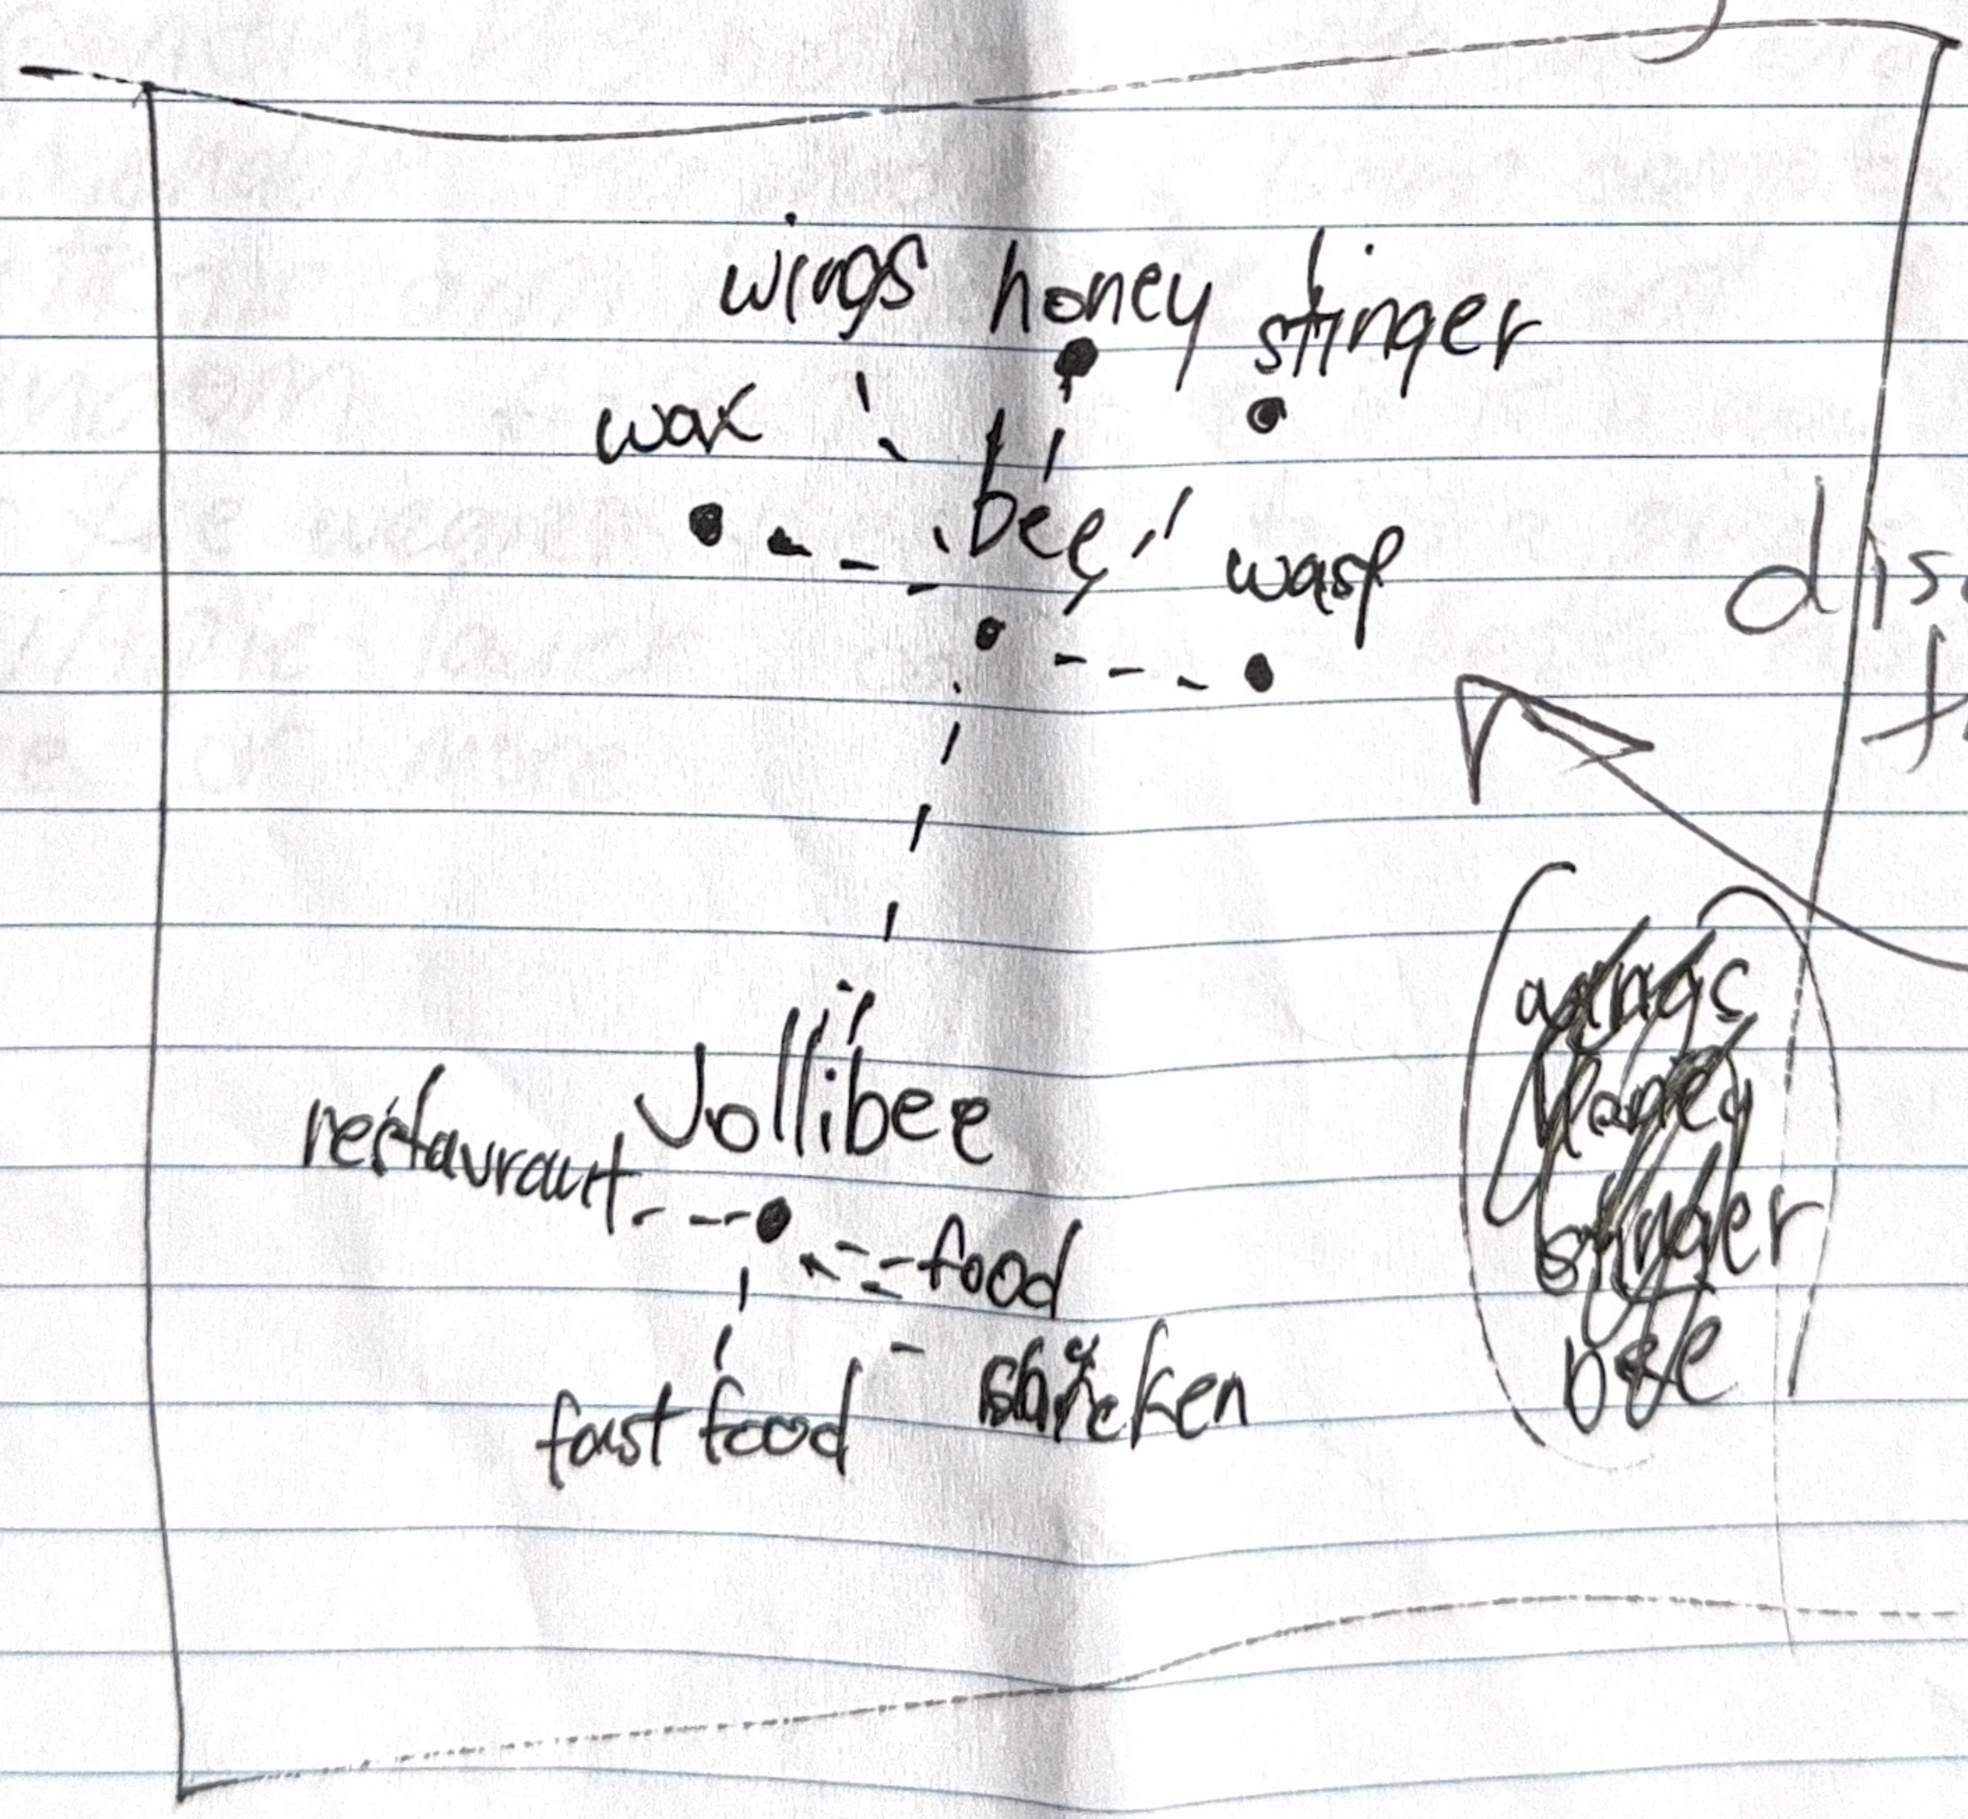

DATE 05/25/2026

INSTRUCTOR DR RODOLFO C. RAGA

SUBJECT ITC C508 - 401 i | ITE ELECTIVE 4

DO NOT TEAR ANY PAGE OUT OF THIS
EXAMINATION BOOK

1. Word Embeddings is the process of forming a word into a numerical value/vector for a computer to understand it better and map it in a semantic space like its own address similar to a GPS. ~~Cancel~~ with that being said all the words on a data set are mapped excluding the stopwords of ~~course~~ course and all the words that are similar based on its features are mapped closer to each other while the opposite or antonyms are far or somewhat parallel ~~to the~~ and scored from -1 to +1 based on its feature for the nlp to identify similarities and relationships

	wings	stinger	honey	wax	wasp
bee	0.7	0.7	0.8	0.6	0.4
wasp	0.7	0.7	0.1	0.1	0.4

no!

7.) In vectorization process the words are converted to a numerical value hence that is the reason why it is equivalent to a single linear regression. The only difference is it you are trying to predict classification which will be aided by a activation function like sigmoid or softmax while relu or ~~regula~~ ELU for regression then computes the weighted sum to the actual value

expanding the network depth and width can enable the model to learn complex patterns similar to the concept of random forest where it is a way for the weaker then, which is a single vs. multiple layer, can work better than one or more

3.) a parameter is located within the model ~~(created and)~~ and the one that holds the model's actual learned intelligence like the weight and biases in which the weights are initially randomize by default through forward pass it runs and utilized by the hidden layer

on the other hand hyperparameters are the one being configured ~~(and tested through)~~ and rigorously tested through experimentation to find the optimal value to guide how the model learns like in learning rate it is like the speed on how the mode learns or in our case the speed on how you read and understand a certain topic when you are studying it you set it too ~~fast~~ you might miss some important details or if the neural network's case the optimal value but if you set it too slow it might take time and resources so finding the optimal value can be the model learns effectively and ~~the~~ efficiently
